

Slim4 is a brand new product launched by Florim and intended to optimize wall and floor covering works. The company has developed a production technology, which allows reducing the thickness of porcelain stoneware tiles to 4mm. Completely different from other methods used in the sector, the new technique compacts the raw material under pressure to the point that the tiles become exceptionally thin yet highly resistant even without the addition of reinforcing fibers; it also eliminates the problems associated with the tension of the material and the durability of the tiled surface, facilitating cutting, drilling and maintenance. There are no limitations in applying surface graphics compared to the «normal» tiles; raw materials also remain unchanged. Slim4 will work for both walls and flooring, and is especially advised for renovation works, as it allows for over-cladding (which will save you time and money on demolition and removal works). In case of new construction, an advantage of Slim4 is the reduced load on the supporting structures. MANUFACTURER: FLORIM // INFO: WWW.FLORIM.IT
